EDG1228 SA-EL Quick Start Guide

NOTE: It's very important that you install the software before connecting the SA-EL to your computer.

The following instructions will explain how to install the EDG1228 SA-EL and the accompanying software.

1. Insert the CD into your computer's CD drive. You will see the following menu screen:

2. Click on **Step 1. USB Driver Install.**
3. Once the driver is installed, connect the SA-EL to the USB port. Windows will detect and install the SA-EL.
4. Select Step 2. **mobile PhoneTools Install.**
5. During the software installation you will be given the option to install the **Persistent Connection Features**. The Persistent Connection Features are:
 - a. Start mobile PhoneTools upon boot-up of your computer; and
 - b. Automatic Internet connection (if the connection is dropped, mobile PhoneTools will automatically reconnect).
6. After the software is installed, mobile PhoneTools will prompt you to restart your computer.

7. Launch mobile PhoneTools from the desktop icon. Mobile PhoneTools will detect the SA-EL.
8. If you selected the Persistent Connection Features, mobile PhoneTools will automatically create a GPRS/EDGE data connection. By default, mobile PhoneTools uses your carrier's default APN, Username and Password.
9. If you did not install the Persistent Connection Features click on the  Globe Icon to create a GPRS/EDGE data connection. Follow the Internet Connection wizard. Select GPRS as the connection type with no fallback connection. Select **Launch Connection** when the wizard is finished.
10. If you are using a custom APN from your carrier, select **MENU-Setup-Internet Connections**. Right-click on the icon and select **Properties** to change you settings.
11. To start or end a data connection click on the Globe icon from the mobile PhoneTools Manager.
